Jose E. Labra Gayo, Eric Prud'hommeaux, Iovka Boneva, Dimitris Kontokostas,
Validating RDF Data, Synthesis Lectures on the Semantic Web, Vol. 7, No. 1, 1-328,
DOI: [10.2200/S00786ED1V01Y201707WBE016](https://doi.org/10.2200/S00786ED1V01Y201707WBE016), Morgan & Claypool (2018)
Online version: <http://book.validatingrdf.com/>

RDF graphs

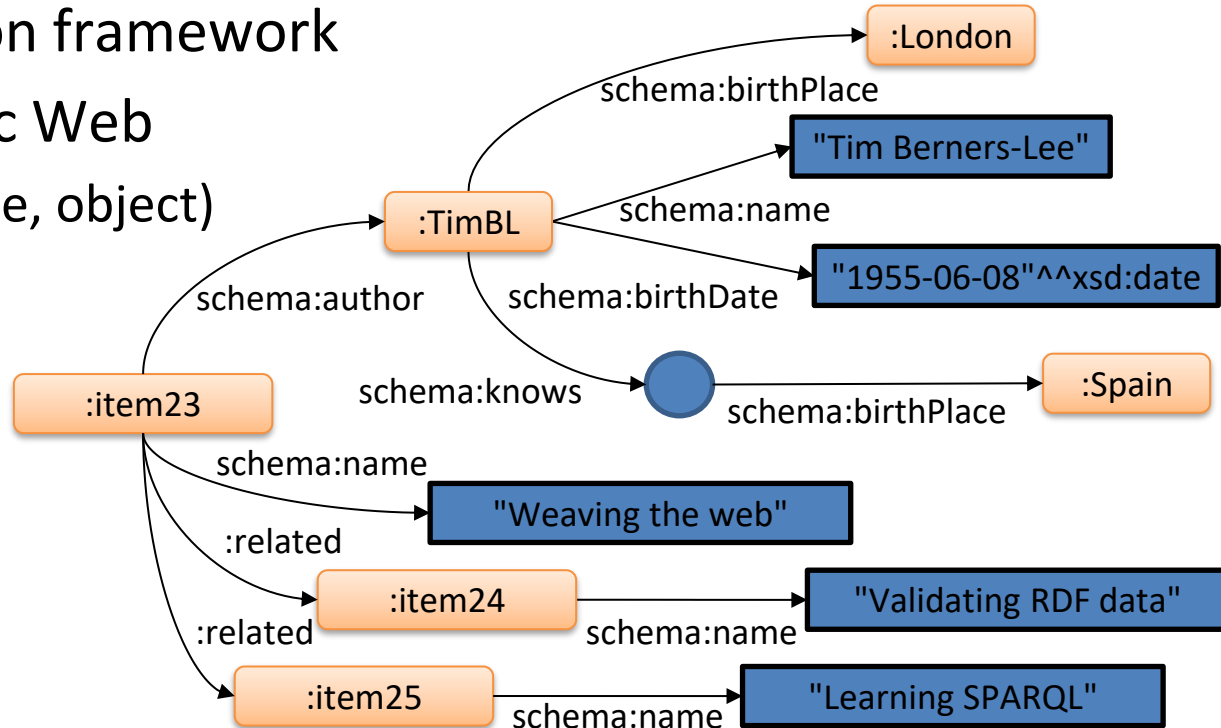

RDF = resource description framework

Lingua franca of Semantic Web

Triples: (subject, predicate, object)

Predicates = URIs

Interoperability

Try it: <https://rdfshape.weso.es/link/17089394117>

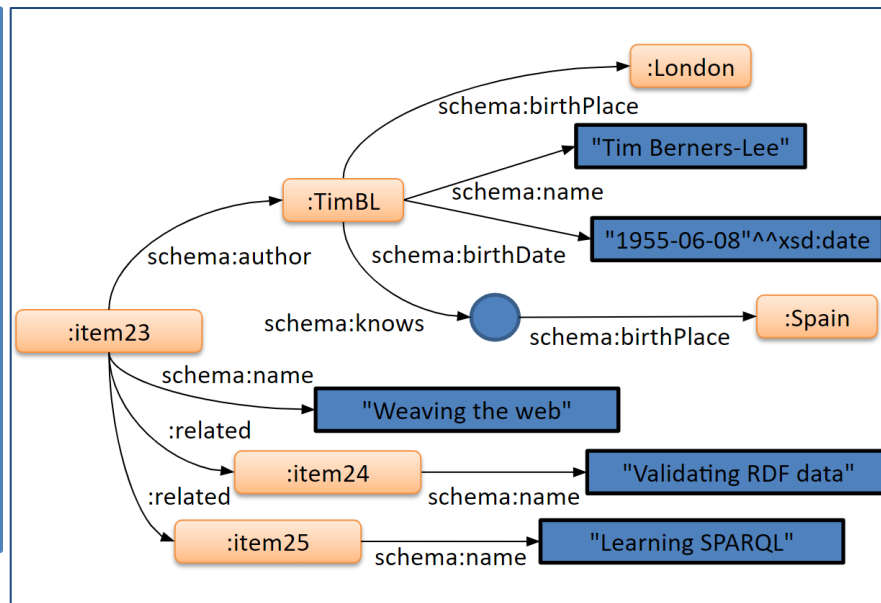

RDF syntaxes

One data model, several syntaxes: Turtle, N-Triples, JSON-LD, ...

Turtle

```
prefix :      <http://example.org/>
prefix xsd:    <http://www.w3.org/2001/XMLSchema#>
prefix rdf:    <http://www.w3.org/1999/02/22-rdf-syntax-ns#>
prefix schema: <http://schema.org/>
```

```
:item23 schema:name      "Weaving the web"      ;
        schema:author    :timbl                  ;
        :related         :item24, :item25        .
:timbl  schema:name      "Tim Berners-Lee"      ;
        schema:birthDate "1955-06-08"^^xsd:date ;
        schema:birthPlace :london                ;
        schema:knows      _:1                    .
_:1     schema:birthPlace :Spain                 .
:item24 schema:name      "Validating RDF data" .
:item25 schema:name      "Learning SPARQL"      .
```

Why describe & validate RDF?

For producers

- Developers can understand the contents they are going to produce
- They can ensure they produce the expected structure
- Advertise and document the structure
- Generate interfaces

For consumers

- Understand the contents
- Verify the structure before processing it
- Query generation & optimization

Schemas for RDF?

RDF doesn't impose a schema, but...

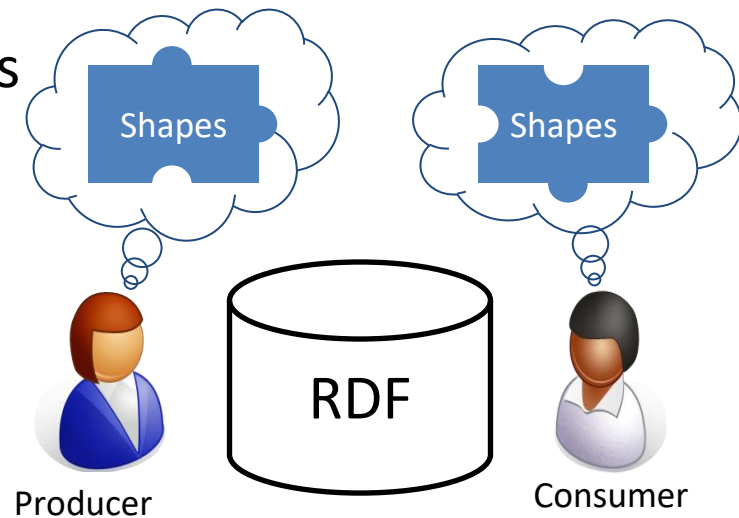

In practice, there are **implicit schemas**

Assumed by producers and consumers

Shapes make schemas explicit

Handle malformed/incomplete data

Avoid defensive programming

Focus discussions on what matters

Help domain experts define their own data models

Understandable by domain experts

...and machine processable

Initial motivation: clinical data models ([FHIR](#))

Distributed data model

Different location, authorities,...

Extensible data models

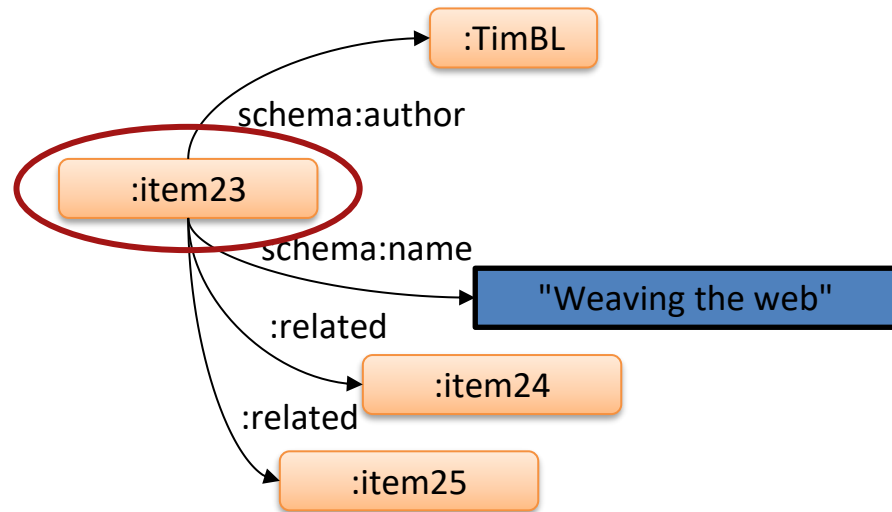

What is a shape?

A shape describes

The form of a node

Incoming/outgoing arcs from a node

Values associated with those arcs

RDF Node

```
:item23 schema:author :timbl ;  
        schema:name   "Weaving the web" ;  
        :related      :item24 , :item25 .
```

ShEx

```
:Book IRI and {  
  schema:author @:Author + ;  
  schema:name   xsd:string ;  
  :related      @:Book   *  
}
```

Evolution of ShEx

2013 RDF Validation Workshop

Conclusions of the workshop:

...need of a higher level, concise language for RDF Validation

ShEx initially proposed (v 1.0)

2014 W3C Data Shapes WG chartered

2017 ShEx 2.0 released as W3C Community group draft

2017 SHACL accepted as W3C recommendation

2019 ShEx 2.1 added support for imports

2019 ShEx adopted by Wikidata

2022 Added support for *extends*

2024 IEEE ShEx (*work in progress*)

Shape Expressions - ShEx

Goal: Concise and human-readable language

3 syntaxes:

- ShExC: Compact syntax, similar to Turtle or SPARQL

- ShExJ: JSON(-LD), for the spec

- ShExR: RDF, based on JSON-LD

Note: Round tripping is possible, convert from one to the other

Semantics inspired by regular expressions

ShEx libraries and demos

Implementations & libraries:

[shex.js](#): Javascript

[Jena-ShEx](#): Java

[SHaclEX](#): Scala (Jena/RDF4j)

[PyShEx](#): Python

[shex-java](#): Java

[Ruby-ShEx](#): Ruby

[RDF-Elixir](#): Elixir

[rudof](#): Rust 

Online demos & playgrounds

[ShEx-simple](#)

[RDFShape](#)

[Wikishape](#)

[ShEx-Java](#)

[ShExValidata](#)

More info: <http://shex.io>

Simple example

Prefix declarations
as in Turtle/SPARQL

```
prefix :      <http://example.org/>
prefix xsd:   <http://www.w3.org/2001/XMLSchema#>
prefix schema: <http://schema.org/>

:Book IRI AND {
  schema:name    xsd:string    ;
  :related       @:Book        *
}
```

Nodes conforming to `:Book` must

- Be `IRI`s and
- Have property `schema:name` with a value of type `xsd:string` (exactly one)
- Have property `:related` with values conforming to `:Book` (zero or more)

RDF Validation using ShEx

RDF Data

Schema

```
:Book IRI AND {  
  :name xsd:string ;  
  :related @:Book *  
}
```

Shape map

```
:a@:Book ✓  
:b@:Book, ✓  
:c@:Book, ✗  
:d@:Book, ✗  
:e@:Book, ✗  
:f@:Book ✗
```

```
:a :name "Title A" ;  
   :related :b .  
:b :related :a ;  
   :name "Title B".  
:c :name "Title C1", "Title C2" .  
:d :name 234 .  
:e :namme "Title E" .  
:f :name "Title F" ;  
   :related :a, _:1 .  
_:1 :name "Unknown title" .
```

Try it ([RDFShape](#))

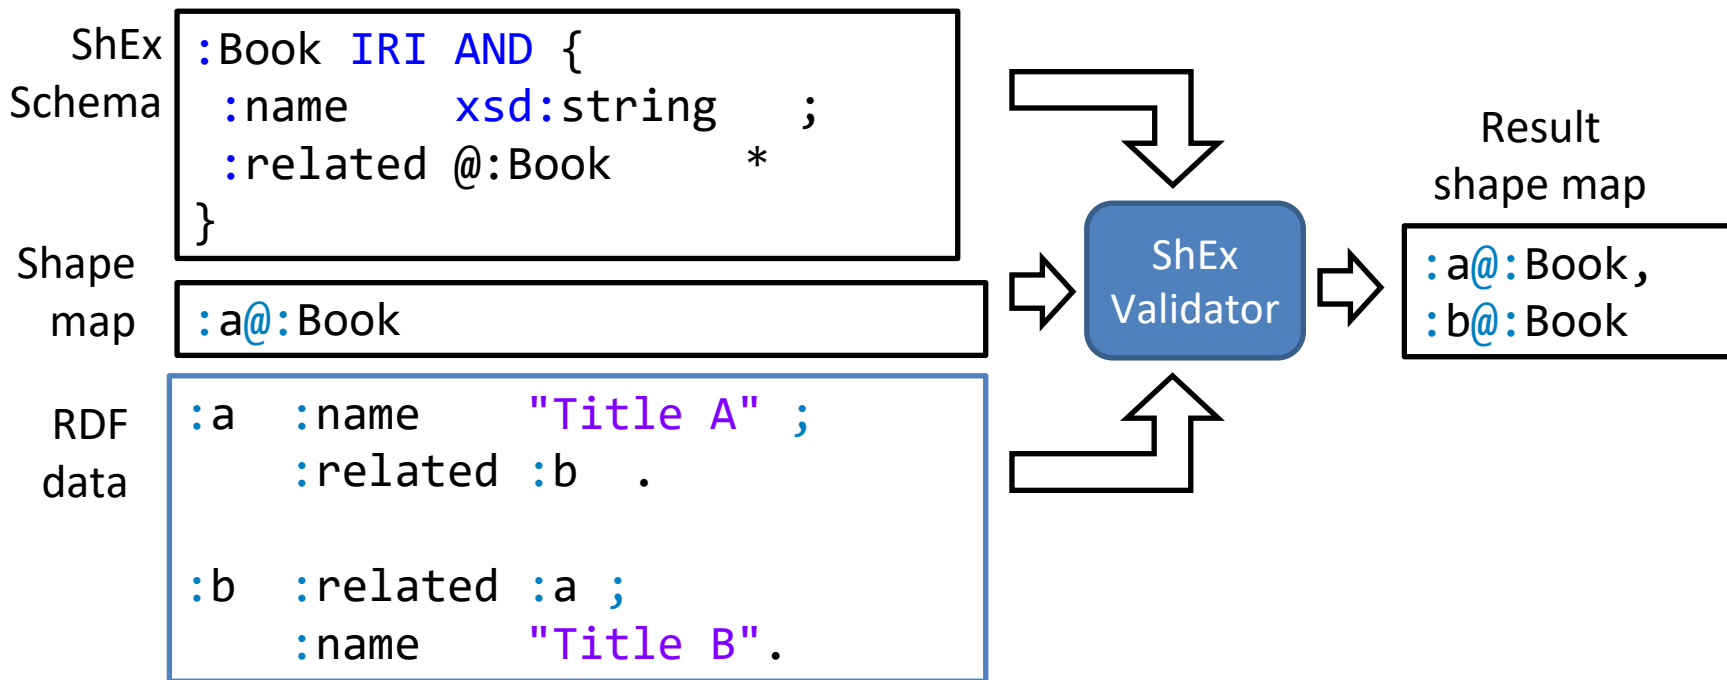

Try it ([Simple ShExDemo](#))

Validation process

Input: RDF data, ShEx schema, Shape map

Output: Result shape map

Node constraints

Constraints over a node (without considering its neighbourhood)

```
:Book {  
  :name          xsd:string  
  :datePublished xsd:date  
  :numberOfPages MinInclusive 1  
  :author        @:Person  
  :genre          [ :Fiction :NonFiction ]  
  :isbn           /isbn:[0-9X]{10}/  
  :publisher      IRI  
  :audio          .  
  :maintainer     @:Person OR  
                  @:Organization  
}  
:Person {}  
:Organization {}
```

```
:item23  
  :name          "Weaving the Web"  
  :datePublished "2012-03-05"^^xsd:date  
  :numberOfPages 272  
  :author        :timbl  
  :genre          :NonFiction  
  :isbn           "isbn:006251587X"  
  :publisher      <http://www.harpercollins.com/>  
  :audio          <http://audio.com/item23>  
  :maintainer     :alice
```

Try it: ([RDFShape](#))

Cardinalities

Inspired by regular expressions: +, ?, *, {m,n}

By default {1,1}

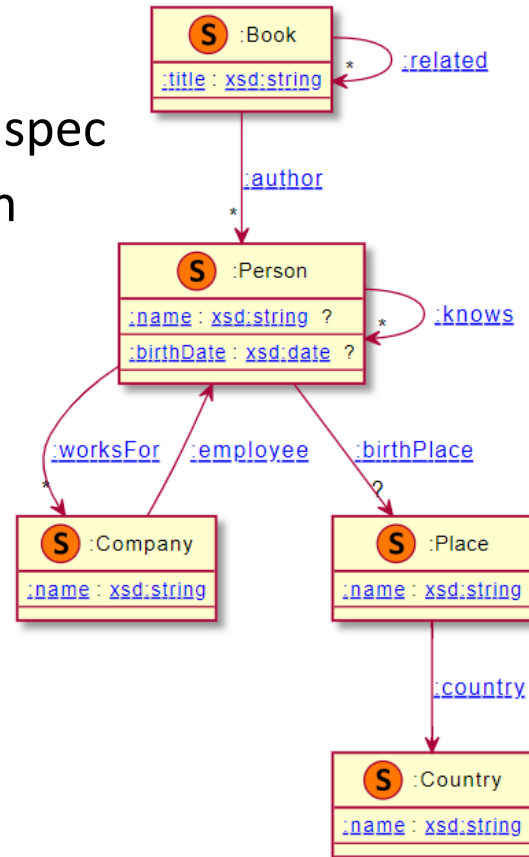

```
:Book {  
  :name          xsd:string          ;  
  :numberOfPages xsd:integer    ?    ;  
  :author         @:Person          +    ;  
  :publisher      IRI              ?    ;  
  :maintainer     @:Person          {1,3} ;  
  :related        @:Book            *  
}  
:Person {}  
:Organization {}
```

```
:item23  
  :name          "Weaving the Web"    ;  
  :numberOfPages 272                  ;  
  :author         :timbl, :markFischetti ;  
  :maintainer     :alice, :bob        .
```

Recursive schemas

Support for recursive (cyclic) data models is part of the spec
Well formed semantics based on stratified negation

```
:Book { :title      xsd:string ;
        :author    @:Person * ;
        :related   @:Book * }
:Person { :name      xsd:string ? ;
          :birthDate xsd:date ? ;
          :birthPlace @:Place ? ;
          :knows     @:Person * ;
          :worksFor  @:Company * }
:Place { :name      xsd:string ;
         :country   @:Country }
:Country { :name      xsd:string }
:Company { :name      xsd:string ;
          :employee  @:Person }
```

Open/Closed content models

RDF semantics mostly presume open content models

Shape expressions are open by default

Enable extensibility

But...some use cases require closed content models

Added CLOSED keyword

```
:Book {  
  :name    xsd:string  ;  
}
```

```
:Book CLOSED {  
  :name    xsd:string  ;  
}
```

```
:a :name "Weaving the web" ;  
   :isbn "006251587X" .
```

Try it: [RDFShape](#)

Open/Closed properties

Property values are closed by default (closed properties)

```
:Book {  
  :code /isbn:[0-9X]{10}/ ;  
}
```

```
:item23 :code "isbn:006251587X" .
```

```
:item23 :code 23 .
```

Properties can be repeated

```
:Book {  
  :code /isbn:[0-9X]{10}/ ;  
  :code /isbn:[0-9]{13}/  
}
```

```
:item23 :code "isbn:006251587X" ,  
        :code "isbn:9780062515872" .
```

EXTRA declares properties as open

```
:Book EXTRA :code {  
  :code /isbn:[0-9X]{10}/ ;  
}
```

```
:item23 :code "isbn:006251587X" ,  
        :code 23 .
```

Try it: [RDFShape](#)

Triple expressions

“Unordered” regular expressions: Regular bag expressions

```
:Person {
  ( :name      xsd:string |
    :firstName xsd:string + ;
    :lastName  xsd:string
  ) ;
  :birthDate  xsd:date   ?
}
```

```
(name |
  firstName + ;
  lastName
) ;
birthDate ?
```

```
(n | f + ; l ) ; b?
```

```
:alice → n
:bob   → f l
:carol → f l f
```

```
:dave → n f
```

```
:alice :name      "Alice Cooper"      ;
       :birthDate "2010-02-23"^^xsd:date .

:bob   :firstName "Robert"             ;
       :lastName  "Smith"              .

:carol :firstName "Carol"              ;
       :lastName  "King"               ;
       :firstName "Carole"             .
```

```
:dave :name      "Dave Navarro"      ;
       :firstName "Dave"              .
```

Try it: [RDFShape](https://rdfshape.org/)

Logical operators

Shape Expressions can be combined with **AND**, **OR**, **NOT**

```
:Book {  
  :name    xsd:string ;  
  :author @:Person OR @:Organization ;  
}  
  
:AudioBook @:Book AND {  
  :name           MaxLength 20 ;  
  :readBy         @:Person      ;  
} AND NOT {  
  :numberOfPages . +  
}  
  
:Person {}  
:Organization {}
```

```
:item24 :name      "Weaving the Web" ;  
        :author    :timbl              ;  
        :readBy    :timbl              .
```

```
:item23 :name      "Weaving the Web" ;  
        :author    :timbl              ;  
        :numberOfPages 272             ;  
        :readBy    :timbl              .
```

ShEx allows **NOT** combined with recursion (semantics based on stratified negation)

Try it: [RDFShape](#)

Importing schemas

`import` statement can be used to import schemas

<http://validatingrdf.com/tutorial/examples/book.shex>

```
:Book {
  :title    xsd:string    ;
}
:Person {
  :name     xsd:string ? ;
}
```

```
import <https://www.validatingrdf.com/examples/book.shex>
```

```
:AudioBook @:Book AND {
  :title      MaxLength 20 ;
  :readBy     @:Person    ;
}
```

```
:item24 :name      "Weaving the Web" ;
        :author    :timbl             ;
        :readBy     :timbl             .
```

Machine processable annotations

Annotations based on RDF

Lots of applications, e.g. generate forms from shapes

```
prefix schema: <http://schema.org/>
prefix : <http://example.org/>
prefix xsd: <http://www.w3.org/2001/XMLSchema#>
prefix ui: <http://www.w3.org/ns/ui#>

start = @:User

:User {
  schema:name      xsd:string           // ui:label "Name"      ;
  schema:birthDate xsd:dateTime         // ui:label "Birth date" ;
  schema:gender    [ schema:Male schema:Female ] // ui:label "Gender"
}
```

A screenshot of a web form generated from the SHEx shape. The form is titled ':User' and contains three input fields: 'Name:' with the value 'Alice', 'Birth date:' with the value '23/04/2010', and 'Gender:' with a dropdown menu showing 'schema:Male'. A blue 'Check' button is at the bottom.

Try it:

[Eric's demo](#)

<https://rdfshape.weso.es/link/17095003321>

More complex Shape Maps

Shape Maps define which nodes validate with which shapes

Examples:

{ FOCUS a :Person}@:User	https://rdfshape.weso.es/link/17095033013
{ FOCUS schema:name _}@:Book	https://rdfshape.weso.es/link/17095014386
SPARQL "" PREFIX schema: <http://schema.org/> SELECT ?book WHERE { ?book schema:name ?name; schema:author ?author } ""@:Book	https://rdfshape.weso.es/link/17095031848

Inheritance model for ShEx

extends allows to reuse existing shapes adding new content

Handles closed properties and shapes

```
:Book {  
  :name      xsd:string ;  
  :author    @:Person ;  
  :code      /isbn:[0-9]{13}/ ;  
  :code      /isbn:[0-9X]{10}/  
}
```

```
:LibraryBook extends @:Book {  
  :code      /internal:[0-9]*/ ;  
}
```

```
:item23 :name      "Weaving the Web" ;  
        :author    :timbl ;  
        :code      "isbn:006251587X" ;  
        :code      "isbn:9780062515872" ;  
        :code      "internal:234" .
```

Other features

Multiple inheritance

Abstract shapes

More details: ***Shape Expressions with Inheritance***, Iovka Boneva, Jose Emilio Labra Gayo, Eric Prud'hommeaux, Katherine Thornton, Andra Waagmeester
Extended Semantic Web Conference, Portoroz, Slovenia, 2025 – 2025
https://labra.weso.es/publication/2025_shex_inheritance/ (Next Wednesday 16:20h)

Try it:

<https://rdfshape.weso.es/link/17487753484>

ShEx vs SPARQL

SPARQL pros:

Expressive

Ubiquitous

SPARQL cons:

Expressive

Idiomatic - many ways to encode the same constraint

Non recursive

```
<User> {  
  schema:name    xsd:string ;  
  schema:gender [ schema:Female schema:Male ]  
}
```

```
ASK {{ SELECT ?Person {  
    ?Person schema:name ?o .  
  } GROUP BY ?Person HAVING (COUNT(*)=1)  
}  
{ SELECT ?Person {  
    ?Person schema:name ?o .  
    FILTER ( isLiteral(?o) &&  
             datatype(?o) = xsd:string )  
  } GROUP BY ?Person HAVING (COUNT(*)=1)  
}  
{ SELECT ?Person (COUNT(*) AS ?c1) {  
    ?Person schema:gender ?o .  
  } GROUP BY ?Person HAVING (COUNT(*)=1)}  
{ SELECT ?Person (COUNT(*) AS ?c2) {  
    ?S schema:gender ?o .  
    FILTER ((?o = schema:Female ||  
             ?o = schema:Male))  
  } GROUP BY ?Person HAVING (COUNT(*)=1)}  
  FILTER (?c1 = ?c2)  
}
```

3 syntaxes: ShExC, ShExJ, ShExR

ShExC

```
prefix :      <http://example.org/>
prefix xsd:   <http://www.w3.org/2001/XMLSchema#>
prefix schema: <http://schema.org/>
```

```
:Book {
  schema:name    xsd:string  ;
  :related       @:Book     *
}
```

ShExR (RDF, Turtle)

```
:Book a sx:ShapeDecl ;
sx:shapeExpr [ a sx:Shape ;
sx:expression [ a sx:EachOf ;
sx:expressions (
  [ a sx:TripleConstraint ;
    sx:predicate schema:name ;
    sx:valueExpr [ a sx:NodeConstraint ;
      sx:datatype xsd:string
    ] ]
  [ a sx:TripleConstraint ;
    sx:predicate :related ;
    sx:valueExpr [ a sx:NodeConstraint ;
      sx:valueExpr :Book ] ] ) ] ] .
```

ShExJ (JSON LD)

```
{ "type" : "Schema",
  "@context" : "http://www.w3.org/ns/shex.jsonld",
  "shapes" : [ {
    "type" : "Shape",
    "id" : "http://example.org/Book",
    "expression" : {
      "type" : "EachOf",
      "expressions" : [ {
        "type" : "TripleConstraint",
        "predicate" : "http://schema.org/name",
        "valueExpr" : {
          "type" : "NodeConstraint",
          "datatype" : "http://www.w3.org/2001/XMLSchema#string"
        }
      },
      {
        "predicate" : "http://example.org/related",
        "valueExpr" : "http://example.org/Book",
        "min" : 0,
        "max" : -1,
        "type" : "TripleConstraint"
      }
    ]
  } ] }
```

It's possible to
roundtrip from
each one

ShEx from a more theoretical point of view

Grammar divided in two main blocks

se Shape expressions

Describe nodes

te Triple expressions

Describe the neighbourhood of nodes

Incoming/outgoing arcs

Regular *Bag* Expressions

Recursion and negation

Stratified negation

\mathcal{S}	$::=$	$l \mapsto se^*$	
se	$::=$	IRI BNode ...	Node constraints
		cond	A boolean condition on nodes
		$se_1 \text{ AND } se_2$	Conjunction
		$se_1 \text{ OR } se_2$	Disjunction
		NOT se	Negation
		@ l	Shape label reference for $l \in \Lambda$
		{ te }	Triple expression te
te	$::=$	$te_1; te_2$	Each of te_1 and te_2
		$te_1 \mid te_2$	Some of te_1 or te_2
		$\neg \xrightarrow{p} @l$	Triple with predicate p that conforms to shape expression identified by l
		te^*	Zero or more te

Summary

More ShEx features

Stems, named expressions, nested shapes, semantic actions, ...

And ShEx tools

Inference ShEx from data (sheXer), editors, KG subsets, ...

ShEx and SHACL compared ([see later](#))

Different underlying philosophy

ShEx more inspired on grammars than on constraints

Separation of concerns

[XMLSchema2ShEx](#): Convert XML Schemas to shapes

[ShExML](#): Domain specific language to convert data to RDF

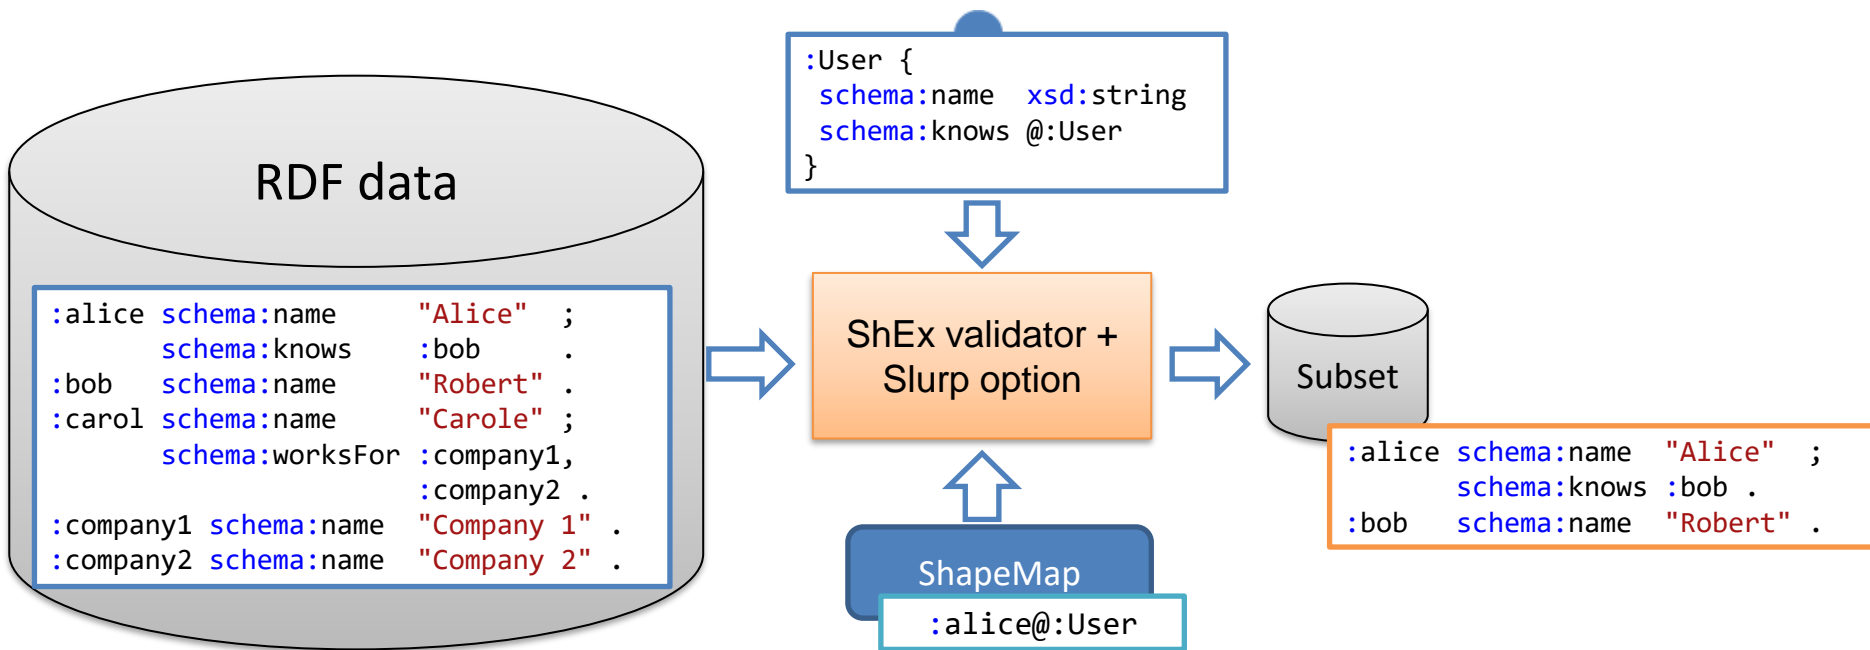

Input formats: CSV, XML, JSON, SQL

Subsetting based on Shapes

Generate subsets from ShEx

Slurp option: when validating, collect visited nodes/triples

Some ShEx use cases and future work

Wikidata, FHIR, SOLID

Wikidata

In May, 2019, Wikidata announced ShEx adoption

New namespace for schemas

Example (Human Gene): <https://www.wikidata.org/wiki/EntitySchema:E37>

Wikibase also contains entity schemas

Online demo: [wikishape](https://www.wikidata.org/wiki/EntitySchema:E37)

EntitySchema: [Discussion](#) [Read](#) [View history](#) [Search Wikidata](#)

human gene (E37)

language code	label	description	aliases	edit
en	human gene	schema of a human gene according to Gene Wiki		edit
da	menneske-gen			edit
de	Menschliches Gen			edit
eo	homa geno			edit
es	gen humano	esquema de gen humano de acuerdo al proyecto Gene Wiki		edit
fr	gène humain	schema d'un gène humain selon Gene Wiki		edit
it	gene umano	schema per descrivere un gene umano		edit
ja	ヒトの遺伝子	Gene Wikiにおいてヒトの遺伝子を記述するためのスキーマ		edit
nl	menselijk gen	basis schema voor een menselijk gen in Wikidata volgens gene wiki		edit
pt	gene humano			edit

```
# E108: genome assembly
IMPORT <https://www.wikidata.org/wiki/Special:EntitySchemaText/E108>
PREFIX E108: <https://www.wikidata.org/wiki/Special:EntitySchemaText/E108#>

# E109: human chromosome
IMPORT <https://www.wikidata.org/wiki/Special:EntitySchemaText/E109>
PREFIX E109: <https://www.wikidata.org/wiki/Special:EntitySchemaText/E109#>

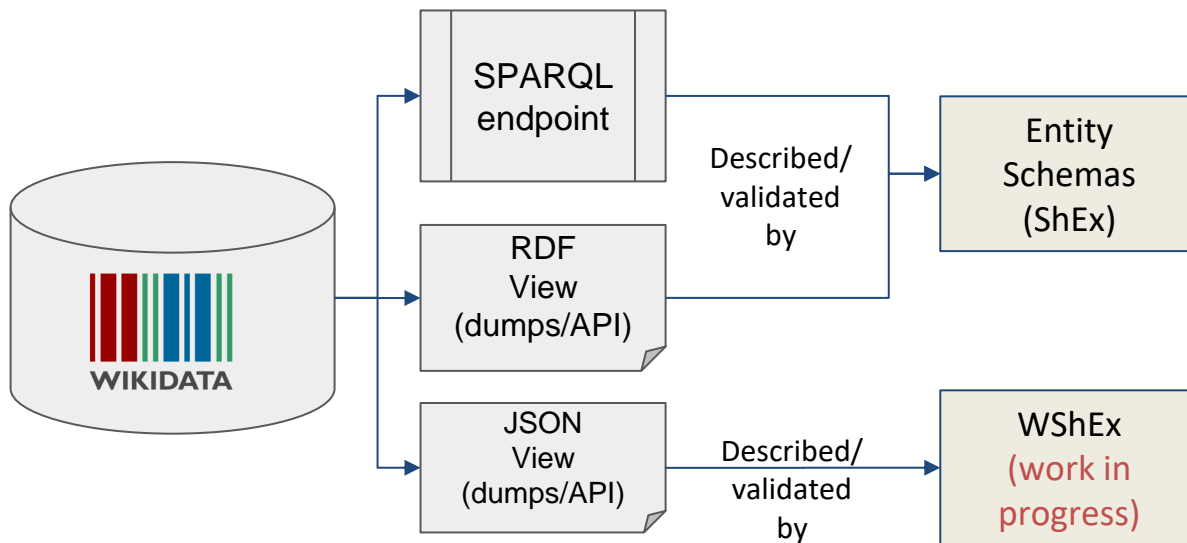

# Shape Expression for Human genes in Wikidata
PREFIX wd: <http://www.wikidata.org/entity/>
PREFIX wdt: <http://www.wikidata.org/prop/direct/>
PREFIX p: <http://www.wikidata.org/prop/>
```

[check entities against this Schema](#) | [edit](#)

Wikidata entity schemas

Entity schemas describe RDF view

Available through SPARQL endpoint, RDF dumps

Shapes ecosystems

Wikidata provides a whole ShEx ecosystem

Entity schemas evolve and relate between each other

Directory:

https://www.wikidata.org/wiki/Wikidata:Database_reports/EntitySchema_directory

Some challenges

- Different schemas for the same type of entities?

 - Some schemas stress some aspects while others stress others

- Evolution of schemas

- Searching entity schemas

FHIR use case

Clinical information model

Observations

Procedures

Medications

+ 150 other things

Custom schema language

Use-case tailored expressivity

Available as JSON structure
(not JSON-schema)

Developer-friendly

Pretty HTML

e.g. Observation

<https://hl7.org/fhir/observation#resource>

Name	Flags	Card.	Type	Description	?
Observation	N		DomainResource	Measurements and simple assertions	
identifier	Σ	0..*	Identifier	Business Identifier for observation	
code	Σ	1..1	CodeableConcept	Type of observation (code / type)	
subject	Σ	0..1	Reference(Patient Group BiologicallyDerivedProduct)	Who and/or what the observation is about	
value[x]	Σ I	0..1		Actual result	
valueQuantity			Quantity		
valueAttachment			Attachment		
referenceRange	I	0..*	BackboneElement	Provides guide for interpretation + Rule: Must have at least a low or a high or text	
low	I	0..1	SimpleQuantity	Low Range, if relevant	
high	I	0..1	SimpleQuantity	High Range, if relevant	
component	Σ	0..*	BackboneElement	Component results	
code	Σ	1..1	CodeableConcept	Type of component observation (code / type)	
value[x]	Σ	0..1		Actual component result	
valueQuantity			Quantity		
valueAttachment			Attachment		
referenceRange		0..*	see referenceRange	Provides guide for interpretation of component result	

FHIR Observation

Standard FHIR tree representation...

Name	Flags	Card.	Type	Description
Observation	N		DomainResource	Measurements and simple assertions
Identifier	Σ	0..*	Identifier	Business Identifier for observation
code	Σ	1..1	CodeableConcept	Type of observation (code / type)
subject	Σ	0..1	Reference(Patient Group BiologicallyDerivedProduct)	Who and/or what the observation is about
value[x]	Σ I	0..1		Actual result
valueQuantity			Quantity	
valueAttachment			Attachment	
referenceRange	I	0..*	BackboneElement	Provides guide for interpretation + Rule: Must have at least a low or a high or text
low	I	0..1	SimpleQuantity	Low Range, if relevant
high	I	0..1	SimpleQuantity	High Range, if relevant
component	Σ	0..*	BackboneElement	Component results
code	Σ	1..1	CodeableConcept	Type of component observation (code / type)
value[x]	Σ	0..1		Actual component result
valueQuantity			Quantity	
valueAttachment			Attachment	
referenceRange		0..*	see referenceRange	Provides guide for interpretation of component results

...expressed as "Graphical" ShEx

Name	Type	Card.	Description

```

Solid project

SOLID (SOcial Linked Data): Promoted by Tim Berners-Lee

Goal: Re-decentralize the Web

- Separate data from apps

- Give users more control about their data

- Internally using linked data & RDF

Shapes needed for interoperability

"...I just can't stop thinking about shapes.", Ruben Verborgh

<https://ruben.verborgh.org/blog/2019/06/17/shaping-linked-data-apps/>

Shape trees for SOLID

- Map graphs in a resource hierarchy to Shapes
- Shape trees provides a "typing" for a filesystem
- Deliverable of the Solid Application Interoperability Task Force
- Provide validation on create, update and delete operations

<https://shapetrees.org/TR/specification/>
